Final project portfolio instructions

Complex Systems and Applications

Purpose: This portfolio is a short, organised presentation of your final project.

What you need to submit

Your portfolio should help a reader understand what problem you worked on, what data and methods you used, what results you obtained, and what you learned from the process.

- The completed final project notebook, with all cells run and outputs visible.
- A short README, introduction, or report explaining the project in your own words.
- A brief description of the data, workflow, and evaluation method.
- Key results, such as metrics, plots, confusion matrix, example predictions, or other relevant outputs.
- A short reflection on what worked well, what was difficult, and what could be improved.

Accepted portfolio formats

You may choose the format that best fits your technical comfort level. GitHub is encouraged, but it is not the only acceptable option.

Portfolio Format	When to Choose It	What to Submit
GitHub	Recommended for students comfortable with Git/GitHub.	Notebook, README, exported HTML/PDF, optional images or supporting files.
Drive folder	A fully acceptable low-friction option.	Notebook, report, outputs, plots/screenshots, and any supporting files.
GitHub Pages or similar	Optional advanced presentation route.	A simple webpage presenting the final project and linking to the notebook/report.
Canva, Wix, or Adobe Portfolio	Optional visual portfolio route for students who prefer a simple website or designed page.	A public or shared page presenting the project, with links to the notebook/report and key results.
Report from the notebook	Minimum valid fallback.	A PDF export from the completed notebook, with results visible.

Recommended structure

1. Project title and short description.
2. Problem statement: what you tried to predict, classify, cluster, or explain.
3. Data set: where it came from and what the main variables or inputs represent.
4. Method: the main model or models used, including any preprocessing steps.
5. Results: the most important numbers, plots, and observations.
6. Interpretation: what the results mean, including limitations.
7. Reflection: what you would improve with more time.

Minimum acceptable version

If you cannot prepare a GitHub repository or online folder, you may submit a single report exported from your final project notebook. The report must still include the completed code outputs and your written explanations. A notebook without visible outputs or without explanatory text is not enough.

How the portfolio will be assessed

The portfolio grade rewards clarity, organisation, and completeness. It is not meant to require a large collection of separate assignments.

Criterion	Weight
Completed final project included	40%
Clear introduction, README, or short report	25%
Results visible and understandable	20%
Organisation and professional presentation	15%

Practical advice

- Use simple file names and organise your files so another person can open them easily.
- Make sure your notebook runs from top to bottom before submission.
- If you use GitHub, include a README.md file at the top of the repository.
- If you use Drive or OneDrive, check that the sharing link allows the instructor to view the files.
